Fabriq Books

AI-native agent platform for financial operations

The problem

- **SMB finance is stuck between two bad options:** static ledgers (QuickBooks, Xero) that won't bend to *your* matching rules and approval chains, or expensive one-off builds.
- **Today's tools don't learn:** workflows are learnable - e.g. "amount + date window = likely match" - but today's tools don't learn from your data and feedback.
- **Cost:** tens of hours a month on manual reconciliation — and teams still can't optimize the process because the stack won't adapt.

Value proposition

- **Agents run the mechanical work:** matching, categorizing, triaging - so finance spends time on **judgment**, not grunt work.
- **Same agents, many workflows:** reconciliation, payables, collections, or other flows you define — **not** a single vertical silo.
- **Agents that improve:** as the business changes.

Underlying magic

- **Metadata-driven core:** define financial data and workflows once; generate APIs, UI, and permissions from schema — **less custom code**.
- **Agent loop:** plan → execute on live data → **suggest** matches → **learn** from approvals/rejections → **adapt** when patterns shift.
- **Human-in-the-loop by design:** high-confidence paths can auto-execute; **everything else** queues for review

Business model

- **Usage / outcome-aligned pricing:** e.g. per reconciled transaction, per automated account, or active automation months.
- **Example structure:** ~$500/mo base + small per-transaction fee – scales with **value**, not seat count alone.
- **Why:** aligns Fabriq with customers who **automate more**

Go-to-market

- **Phase 1 (0–6 mo):** 2–3 **paying pilots**, reconciliation-first — measurable ROI, case studies.
- **Phase 2 (6–12 mo):** productize reconciliation; **1–2 adjacent verticals**.
- **Phase 3 (yr 2):** payables, AR, multi-account flows → **20–50** paying customers.
- **Channels:** direct (content, LinkedIn); **accounting firm** partners; **vertical** platforms (staffing, e-com).

Competition

	Incumbents	Fabriq
QuickBooks / Xero	Great ledgers, **limited** adaptive automation	**Agent layer** that learns your workflow
NetSuite / SAP	Powerful, **$100K+** and long cycles	**SMB/mid-market** speed + configurability
Ramp / Rillet / Kick	Strong **vertical** agentic plays	**Horizontal** – recon, AP, collections, **your** rules
Custom dev	Fits once, **hard to evolve**	**Product + learning loop**

We don't replace QuickBooks – we're the **autonomous layer** that makes financial workflows **adaptable without a dev shop**.

Team

- **Prasanna Jaganathan — Co-founder, technical lead**
  20+ yrs metadata-driven platforms & financial products. **University of Southern California**
- **Anusha Srinivasan — Co-founder, business lead**
  15+ yrs product, ops and strategy at companies including Amazon; **IIM Ahmedabad**
- **Together:** deep **platform + FinOps engineering** × **product and GTM at scale**.

Financial projections & metrics

- **Today: pre-revenue**; **5–6** active prospect conversations; targeting **pilots within ~90 days**.
- **Market (directional):** TAM ~**$18B** (NA SMB finance software); SAM ~**$2B** (mid-market seeking more than QBO/Xero)
- **Immediate Target:** internal stretch **$50–100K MRR** in first year with **10–15** pilot-scale customers.
- **Funding: bootstrapped** to date; **not raising** now; open to **right** partners later.

Current status, timeline, and ask

- **Product: Working MVP** — autonomous reconciliation agent, **workbench** for review/approval
- **Next:** harden recon from **pilot feedback**; add **payables / collections** agents; deepen **accounting system** integrations.
- **Near-term milestones: 2–3 paying pilots**; published **case studies**; repeatable **onboarding**.
- **Ask: mentorship** on GTM and compliance; **intros** to SMB finance leaders and accounting firms; **credibility** to accelerate pilots — **not** a cash ask today.

Thank you

Fabriq – Autonomous financial agents with humans in the loop.
